

Odin's Watchlist - Worked Examples by Use Case

Real, dated trades each use case would have produced - with the outcome that actually happened

This companion to the Use-Cases playbook answers one question: 'if I had traded each of these patterns in the past, what would have happened?' Every trade below is a genuine stock on a genuine date from the backtest window (2025-07-11 to 2026-07-20, 157 trading days, 315,693 completed trades). The result column is the outcome the data actually recorded, using the tool's own exit rule: a +25% target against a -5% stop, first-hit within 30 trading sessions.

HOW TO READ THE RESULTS HONESTLY

WIN means the +25% target was reached BEFORE the -5% stop. LOSS means the stop hit or the trade expired first. 'Peak in 30d' is the highest the stock actually got to - a LOSS can still show a small positive peak if it rose a little, then fell to the stop before reaching target. Each block shows a few winners AND a few losers on purpose: even the best use cases win only about a quarter of the time, so the losers are the normal texture of the strategy, not a malfunction. Numbers are one 12-month window on daily closes before costs - directional, not a promise.

THE SINGLE MOST IMPORTANT PATTERN IN THIS WHOLE DOCUMENT

The whole-watchlist base rate is just 5% (target hit before stop). The core top-10 by score lifts that to 20%, and the two strongest lenses - persistent leadership and Episodic Pivot - push it to ~24-27% touched. That is the entire edge: roughly 4-5x better than random, NOT a high win rate. You make money by taking many of these with a tight stop, letting the ~1-in-4 winners run to a wide target.

TWO UPGRADES ADDED SINCE THESE EXAMPLES WERE DRAWN

A later round of feature backtests produced two changes that make the picks a little cleaner than the raw examples below: (1) the chart-pattern score is now DATA-DRIVEN - each screener weighted by its measured hit-rate, dead screeners zeroed; and (2) the Episodic Pivot badge now fires only when the gap HELD (closed top-half of range), which backtested ~19% vs ~12% for faded gaps. Several other ideas (regime filter, sector rotation, delivery-trend, smart-money deals, trailing stops) were tested and REJECTED - see section 14 of the main Guide. A paper ledger now also tracks these picks live, per lens.

Tier 1 - the patterns with a clear edge

These three beat the whole-market base rate by 4-5x AND stand up as the strongest cohorts in testing. This is where the money is.

Use case 1 - Core top-10 by Setup Score

The daily staple: buy from the ten highest scores. Two big winners, two high-score losers - note the losers were BOTH score-100 names that still failed, which is exactly why you need the stop and can't skip the lenses.

Measured on this data: 519 completed trades in this cohort. 20% hit the +25% target before the -5% stop; 25% touched +20% at some point. (Whole-watchlist base rate: 5% / 6%.)

Date	Stock	Entry	Score	RS	Result	Peak in 30d
2026-07-09	KALYANKJIL	Rs443	99	+30	WIN - target hit	+30%
2026-07-14	SHARDUL	Rs44.4	78	+49	WIN - target hit	+28%
2025-08-18	STALLION	Rs152.1	70	+47	WIN - target hit	+88%
2026-07-06	AARTECH	Rs57.5	100	+34	LOSS - stopped	-8%
2026-07-06	DIGITIDE	Rs120.5	100	+37	LOSS - stopped	-10%

Use case 2 - Persistent leaders (durable trend)

Stocks that led the market on 12+ of the last 20 days. STALLION here is the textbook case - a full 20/20 strip that ran +88%. The losers (UNICHEMLAB, WABAG) show even proven leaders fail one trade in four-ish; the stop caps it.

Measured on this data: 439 completed trades in this cohort. 21% hit the +25% target before the -5% stop; 24% touched +20% at some point. (Whole-watchlist base rate: 5% / 6%.)

Date	Stock	Entry	Score	RS	20d strip	Result	Peak in 30d
2026-07-07	TBZ	Rs198.7	72	+12	12	WIN - target hit	+31%
2025-08-18	STALLION	Rs152.1	70	+47	20	WIN - target hit	+88%
2025-10-06	INDOTHA	Rs313.8	62	+97	13	WIN - target hit	+44%
2026-07-09	UNICHEMLAB	Rs650.6	100	+37	20	LOSS - stopped	-2%
2026-07-10	WABAG	Rs2221.2	95	+38	20	LOSS - stopped	-1%

PERSISTENCE IS THE STANDOUT - THE NUMBERS THAT MATTER

Measured WITHIN each day's top-10 by score, persistent leaders (strip >=12) hit the target 26% of the time versus 15% for freshly-emerged leaders - the single biggest reliable upgrade any lens gives you. Note also that a persistent leader ALSO firing a fresh breakout the same day is intuitively the premium setup, but in this particular window that exact intersection was too small a sample (49 trades, mostly clustered in one choppy stretch) to claim a clean number - so treat 'durable leader + breakout' as a quality preference, and lean on the persistence number itself, which is robust.

Use case 4 - Episodic Pivot (catalyst gap-up)

A gap of 4%+ on 3x+ volume - a catalyst. SABTNL gapped and ran +80%. Notice these fire even from modest scores (43-50): the gap is a DIFFERENT signal from strength, which is why it adds something. The losers gapped but stalled.

Measured on this data: 235 completed trades in this cohort. 21% hit the +25% target before the -5% stop; 27% touched +20% at some point. (Whole-watchlist base rate: 5% / 6%.)

Date	Stock	Entry	Score	RS	gap% / rvol	Result	Peak in 30d
2025-11-17	SABTNL	Rs1030.2	47	+22	17	WIN - target hit	+80%
2025-07-23	INFOBEAN	Rs538.2	50	+44	15	WIN - target hit	+28%
2025-10-27	BHAGYANGR	Rs120.3	43	+20	14	WIN - target hit	+34%

Date	Stock	Entry	Score	RS	gap% / rvol	Result	Peak in 30d
2025-12-18	AWHCL	Rs514	40	+11	19	LOSS - stopped	+11%
2025-09-04	ATULAUTO	Rs509.1	47	+13	18	LOSS - stopped	+5%

WHY EP EARNS ITS PLACE

At 27% touched it is the highest touch-rate cohort here, and it is independent of the score - it answers 'did something happen today', not 'is it already strong'. Because catalyst moves can fade fast, the tight stop matters even more than usual.

Tier 2 - situational lenses (use to CHOOSE, not to replace the score)

These next patterns, applied across the shortlist, won at ~11-14% - BELOW the score-top-10's 20%. That is not because they're bad, but because the cohorts include lower-scored names. The lesson matches the whole project: relative strength (the score) is the edge; these lenses help you pick a good ENTRY among already-strong names - they are not a substitute for a high score. The examples show real winners, but also why you shouldn't lead with them.

Use case 5 - Wyckoff SOS / breakout trigger

Breakout-structure entries. Big winners exist (MANAKALUCO +69%, SILVERBEES +68%) - but the two score-100 losers are the same AARTECH / DIGITIDE that broke out and immediately failed. A breakout without durable leadership is a coin-flip; confirm the strip first.

Measured on this data: 471 completed trades in this cohort. 11% hit the +25% target before the -5% stop; 14% touched +20% at some point. (Whole-watchlist base rate: 5% / 6%.)

Date	Stock	Entry	Score	RS	phase	Result	Peak in 30d
2026-01-09	MANAKALUCO	Rs38.3	68	+59	Breakout Trigger	WIN - target hit	+69%
2025-12-26	MCL	Rs59	60	+35	Breakout Trigger	WIN - target hit	+50%
2025-12-24	SILVERBEES	Rs209.2	60	+38	Breakout Trigger	WIN - target hit	+68%
2026-07-06	AARTECH	Rs57.5	100	+34	Breakout Trigger	LOSS - stopped	-8%
2026-07-06	DIGITIDE	Rs120.5	100	+37	Breakout Trigger	LOSS - stopped	-10%

Use case 6 - Wyckoff LPS / rebound pullback

Buying the quiet pullback to support after strength. Winners like TCIFINANCE (+63%) came off very high RS. Best used to get a cheaper, tighter-stop entry into a name you already rate - not as a stand-alone screen.

Measured on this data: 267 completed trades in this cohort. 11% hit the +25% target before the -5% stop; 14% touched +20% at some point. (Whole-watchlist base rate: 5% / 6%.)

Date	Stock	Entry	Score	RS	phase	Result	Peak in 30d
2026-01-06	MANGALAM	Rs33.4	64	+33	Rebound Setup	WIN - target hit	+55%
2025-12-22	KESORAMIND	Rs10.9	60	+115	Rebound Setup	WIN - target hit	+27%
2025-12-24	TCIFINANCE	Rs22.5	60	+102	Rebound Setup	WIN - target hit	+63%
2026-07-06	MOREPENLAB	Rs60.8	95	+36	Rebound Setup	LOSS - stopped	+3%
2026-07-17	MAPMYINDIA	Rs1173	70	+31	Rebound Setup	LOSS - stopped	-6%

Use case 7 - Emerging (early move, before leadership)

A volume thrust (3x+) while RS is still modest (0 to +25) - catching the wake-up. Real early winners exist (SHARDUL +68%, DPABHUSHAN +37%), but at just 4% target-hit / 7% touched this is barely above the base rate. This is the honest confirmation of the guide's warning: earlier, but LOWER confidence - a small speculative satellite, never your core.

Measured on this data: 133 completed trades in this cohort. 4% hit the +25% target before the -5% stop; 7%

touched +20% at some point. (Whole-watchlist base rate: 5% / 6%.)

Date	Stock	Entry	Score	RS	rvol	Result	Peak in 30d
2026-07-08	DPABHUSHAN	Rs1076	55	+17	14	WIN - target hit	+37%
2025-07-28	CARTRADE	Rs2066.9	59	+25	8	WIN - target hit	+32%
2026-07-10	SHARDUL	Rs33.6	61	+12	6	WIN - target hit	+68%
2026-07-14	HGS	Rs453.6	65	+5	17	LOSS - stopped	-4%
2026-07-13	PURVA	Rs248.4	72	+14	17	LOSS - stopped	-5%

Anti-patterns - what these examples warn you AWAY from

Trap 1 - high score, empty leadership strip (the one-day flare)

Stocks scoring 75+ but with a near-empty 20-day strip (never a durable leader). At just 10% target-hit - HALF the clean top-10's 20% - this cohort is where high scores go to disappoint. DIGITIDE / GODREJIND / MASTERTR all scored 90+ and still lost. The strip is the single best filter that saves you.

Measured on this data: 27 completed trades in this cohort. 10% hit the +25% target before the -5% stop; 10% touched +20% at some point. (Whole-watchlist base rate: 5% / 6%.)

Date	Stock	Entry	Score	RS	20d strip	Result	Peak in 30d
2026-07-09	KALYANKJIL	Rs443	99	+30	1	WIN - target hit	+30%
2026-07-09	DPABHUSHAN	Rs1151	83	+26	2	WIN - target hit	+28%
2026-07-06	DIGITIDE	Rs120.5	100	+37	1	LOSS - stopped	-10%
2026-07-09	MASTERTR	Rs94.8	91	+22	1	LOSS - stopped	-2%
2026-07-10	GODREJIND	Rs1417.7	91	+34	2	LOSS - stopped	-2%

Trap 2 - high delivery % (the lens we tested and dropped)

High-delivery names that ALSO made the shortlist won ~26% - which looks great, until you realise that's the SAME rate as any other strong shortlist name. That's the whole point: delivery % added nothing BEYOND the strength that already got them listed, so as a stand-alone screen it's noise. It was measured, found redundant, and left out of the score.

Measured on this data: 81 completed trades in this cohort. 26% hit the +25% target before the -5% stop; 28% touched +20% at some point. (Whole-watchlist base rate: 5% / 6%.)

Date	Stock	Entry	Score	RS	deliv%	Result	Peak in 30d
2025-09-16	SEJALLTD	Rs713.8	54	+32	100	WIN - target hit	+38%
2025-07-14	SOMATEX	Rs71.1	42	+65	100	WIN - target hit	+47%
2025-08-22	OSWALSEEDS	Rs18.4	58	+45	100	LOSS - stopped	-5%
2025-10-28	MEGASOFT	Rs194.7	42	+23	100	LOSS - stopped	+14%

THE THREAD THROUGH EVERY EXAMPLE

The SCORE (relative strength) is the edge - it lifts you from a 5% base to a 20% hit rate. PERSISTENCE and EPISODIC PIVOT are the two lenses that genuinely add more. Everything else helps you choose an entry or avoid a trap, but cannot replace a high score plus a durable leadership strip. And in every single cohort - even the best - most trades still lose, so the tight stop and the wide target are what convert this edge into money.

All trades extracted from the project's backtest panels (labeled_panel.csv / ohlc_indicator_panel.csv), window 2025-07-11 to 2026-07-20, 157 trading days, 315,693 completed trades. Exit rule: +25% target / -5% stop, first-hit within 30 sessions. Daily closes, before costs; sub-Rs2 illiquid names excluded. Real outcomes, one market window - directional, not guarantees. Always use a stop-loss.
